Release Notes

ACS WebService® Release 8.0

Overview: Brivo is pleased to offer a redesigned badging interface that streamlines the creation of badge templates. Additionally, Release 8.0 marks enhancements to the Hosted Video Beta project, as well as increased support for its foreign customers.

Badging

The upgraded badging interface utilizes drag-and-drop technology, allowing users to select resizable text and images and move them to a blank palette. Users may also rotate objects by forty-five-degree increments or by specifying the precise degree via a dropdown list. For a comprehensive list of WebService's new badging features, refer to the Cards chapter of the Administrator's Manual.

Badge Conversion

Badge templates created using WebService's older system should transfer data according to the former template's specifications. However, to ensure that the placement of the items is accurate after the conversion, be sure to check the template using the new interface.

Localization

ACS WebService now supports the display of multiple time and date formats. All date and time formats are now displayed according to the browser's country of origin.
