Release Notes

OnSite SE/XE™ Release 2.1.5

Overview: This release renames the XML API to DataSync, better reflecting its capabilities and purpose. Significant improvements to the DataSync interface have also been made, including support for adding cards and user photos from external sources. It also provides improvements for tenant account control of doors and calendar navigation. Lastly, this version supports HSPD-12-compliant solutions for verification and registration of government credentials.

DataSync (formerly XML API) Improvements

This version provides the capability to add cards and card holder photos to the database via DataSync.

Tenant Account Enhancement

Tenant accounts can now be structured with shared doors and the capability to pulse (unlock) a shared door. For example, in a multi-tenant facility, several administrators can be granted the ability to unlock the main entrance without granting other rights to control that door.

Improved Calendar Navigation

For components of the system requiring a date selection, users can now navigate calendars by year as well as month.

Codebench PIVCheck Plus and Certificate Manager Integration

New in this version is the capability to integrate with the PIVCheck Plus and Certificate Manager products from Codebench. This integration provides the capability to register the FASC-N, photo, and printed information from PIV, TWIC, CAC, and FRAC cards to the OnSite SE/XE platforms using PIVCheck Plus Desktop or Mobile editions. PIVCheck Certificate Manager provides the additional capability of re-validating imported cardholder certificates on a periodic basis and suspending a revoked badge automatically within the OnSite SE/XE.

Codebench's PIVCheck Plus and Certificate Manager are available from Brivo.
