Release Notes

ACS OnSite® Release 1.2.0

Overview: This release debuts a new look and feel to the ACS OnSite platform, improving the interface to make using the system more efficient. This release also introduces antipassback to the ACS OnSite platform and includes additional security protocols for email notifications. This release also updates the live status of devices on the Dashboard, provides for increased functionality for schedules, and makes enhancements to Datasync.

New Interface Design

The ACS OnSite interface has been enhanced to make using the system more efficient and to align the OnSite product with other Brivo product offerings. The more frequently used sections of the product are more accessible, and items used primarily during initial account setup are consolidated in the Configuration menu.

Antipassback

This feature allows administrators with appropriate permissions to maintain 2-zone hard and timed/soft antipassback controls.

Email Notification Improvements

Improvements have been added that now support email servers that require additional security.

Live Status on the Dashboard

This feature displays device status, like door ajar, on the dashboard.

Enhanced Scheduling

Schedules on the ACS OnSite are now permitted 32 time schedule blocks per day.

Datasync enhancements

Device status is now available for use in Datasync.
